Welcome from the General Chairman

Prof. Martin Haardt
TU Ilmenau, Germany

Welcome to the 55th Asilomar Conference on Signals, Systems, and Computers. I am deeply honored to serve as the General Chair for this great conference. I first attended Asilomar in 1994 as a doctoral student and have returned almost every year since then. What keeps me coming back is the high-quality technical program, the friendly atmosphere, and the inspiring discussions. Over the years, the Asilomar Conference has been well known for excellent talks, bringing together senior researchers with the best and brightest young scholars. Moreover, many of the emerging research topics and remarkable new results in our research fields have been presented for the first time at Asilomar, since the final papers are only due after the conference. This year, the camera-ready paper submission deadline is on December 3, 2021. Asilomar brings together academic and industrial researchers in signal processing, wireless communication, networking, computing, machine learning, multi-sensor systems, data science, and speech/audio/video, by providing an opportunity to interact and exchange ideas in a relaxed setting.

For the second time in a row, we are in the difficult situation to move from the beautiful Asilomar beaches and parks to a new virtual format. But this provides new opportunities for a world-wide participation and to innovate by creating an engaging virtual component that will be worthwhile for both presenters and attendees. In addition to the on-demand videos that are available on the Asilomar 2021 Virtual Conference Platform, every paper will be presented in a live poster session on Gather.Town. To facilitate a world-wide participation and interaction in these live events, they have been grouped into two time slots of 1.5 hours every morning California time.

We are very proud to have Prof. Yonina Eldar from the Weizmann Institute of Science in Israel as our distinguished plenary speaker this year. She is very well known for her pioneering work on sub-Nyquist sampling and the reconstruction of sparse analog signals that has demonstrated the potential to improve Radar, medical imaging, communications, and storage systems. In her opening plenary on Monday morning (November 1, 2021), she will be talking about “Deep Analog-to-Digital Compression with Applications to Automotive Radar and Massive MIMO”.

We are also very pleased that this year’s tutorial speaker will be Prof. Robert W. Heath Jr. from North Carolina State University. Robert has been a lifelong attendee of Asilomar and has been actively involved in the organization for many years. Robert is an authority in MIMO wireless communications. He is one of the few researchers in this area who spans a bridge between theoretical foundations and practical implementation aspects. Therefore, we are looking forward to his tutorial on “Revisiting MIMO from a Circuits Perspective” on Tuesday morning (November 2, 2021).

This year, we have a very strong technical program with a good mix of invited and regular poster sessions. I would like to sincerely thank our Technical Program Chair Prof. Mario Huemer for his tremendous

efforts in putting together several versions of tentative hybrid conference programs as well as our final virtual program. In the same way, I would like to express my gratitude to our team of Technical Area Chairs: Christoph Mecklenbräuker, Elisabeth De Carvalho, Antonio Marques, Waheed U. Bajwa, Piya Pal, Behtash Babadi, Mikko Valkama, Jani Boutellier, and James Fowler for a brilliantly crafted technical program. They all did an outstanding job in coordinating the technical aspects of this conference. This year's program consists of 390 accepted papers, of which 177 were invited. Among these papers, 113 were submitted to the student paper contest, from which a list of 8 finalists was selected by our Technical Area Chairs. These finalists will present their papers to a committee of judges on Sunday afternoon (October 31, 2021) organized by Prof. Visa Koivunen, and everybody is of course welcome to attend via Zoom. The top three papers will be announced during the Opening Ceremony on Monday morning (November 1, 2021).

Serving as the General Chair for this conference has been a great and rewarding experience. Hopefully, you will enjoy the inspiring conference program and will participate in the inter-active plenary, tutorial, and poster sessions.

Deep Analog-to-Digital Compression with Applications to Automotive Radar and Massive MIMO

Prof. Yonina Eldar

Weizmann Institute of Science

Abstract

The famous Shannon-Nyquist theorem has become a landmark in analog to digital conversion and the development of digital signal processing algorithms. However, in many modern applications, the signal bandwidths have increased tremendously, while the acquisition capabilities have not scaled sufficiently fast. Furthermore, the resulting high rate digital data requires storage, communication and processing at very high rates which is computationally expensive and requires large amounts of power. In this talk we consider a general framework for sub-Nyquist sampling, quantization and processing in space, time and frequency which allows to dramatically reduce the number of antennas, sampling rates, number of bits and band occupancy in a variety of applications. Our framework relies on exploiting signal structure, quantization and the processing task in both standard processing and in deep learning networks leading to a new framework for model-based deep learning. It also allows for the development of efficient joint radar-communication systems. We consider applications of these ideas to a variety of problems in wireless communications, imaging, efficient massive MIMO systems, automotive radar and ultrasound imaging and show several demos of real-time sub-Nyquist prototypes including a wireless ultrasound probe, sub-Nyquist automotive radar, cognitive radio and radar, dual radar-communication systems, analog precoding, sparse antenna arrays, and a deep Viterbi decoder.

Biography

Yonina Eldar is a Professor in the Department of Mathematics and Computer Science, Weizmann Institute of Science, Rehovot, Israel. Tutorial

Revisiting MIMO from a Circuits Perspective

Prof. Robert Heath

North Carolina State University

Abstract

MIMO communication remains an important technology for wireless communication systems. In this tutorial, we revisit classical signal processing models for MIMO wireless communications. We consider how those models may be updated as MIMO systems go to higher carrier frequencies, broader bandwidths and new kinds of array architectures. Through these updates, we revisit concepts from antennas, circuits and array processing including impedance, broadband arrays, beam squint, mutual coupling and polarization.

Biography

Robert W. Heath Jr. received the Ph.D. in EE from Stanford University. He is the Lampe Distinguished Professor at North Carolina State University. He has received several awards including the 2019 IEEE Kiyoo Tomiyasu Award, the 2020 IEEE Signal Processing Society Donald G. Fink Overview Paper Award, and the 2020 North Carolina State University Innovator of the Year Award. He authored “Introduction to Wireless Digital Communication” (Prentice Hall in 2017) and “Digital Wireless Communication: Physical Layer Exploration Lab Using the NI USRP” (National Technology and Science Press in 2012). He co-authored “Millimeter Wave Wireless Communications” (Prentice Hall in 2014) and “Foundations of MIMO Communications” (Cambridge 2019). He is a member-at-large on the IEEE Communications Society Board-of-Governors (2020-2022) and is a past member-at-large on the IEEE Signal Processing Society Board-of-Governors (2016-2018).
